Products for professionals

Description:

Wheel Cleaner quickly and effectively removes brake dust and traffic dirt from the rims

Benefits:

- Strong cleaning power
- Acid free product
- Effortlessly removes brake dust
- Removes road grime at the same time
- Works without brushing when high-pressure cleaning
- High viscosity liquid which allows longer penetration time

Application:

Wheel Cleaner has been specially developed for extreme cleaning of wheels. Especially the persistent brake dust which is removed easily by the special formula. Afterwards it can be washed off by a high-pressure cleaner. In this way the traffic dirt is also removed immediately. Wheel Cleaner is an alkaline product and replaces the acidic cleaner that can cause damage to alloy wheels and concrete floors in particular.

Directions for use:

Spray the rims with Wheel Cleaner in combination with a pressure pump or nebulizer. Allow the product to penetrate for 1-2 minutes depending on the pollution. Then thoroughly spray the rims and the surrounding parts such as brake discs and tyres with a high-pressure sprayer. For best results, apply undiluted. In case of very persistent dirt, use a brush. Use only in the open air or in a well-ventilated area. Do not use in direct sunlight. Do not use on hot or warm rims. Do not let the product dry on stainless steel/aluminium. Especially specially treated aluminium can be sensitive to damage. Always check the product in an inconspicuous area before use to avoid possible damage.

Tips & tricks:

For very light-sensitive rims, use Iron Wash.
